

Improving performance through technology; delivering measurable results.

Performance goes up.
The numbers prove it.

We find the bottleneck, measure it, improve it with technology, then measure it again the same way.

deltaup.ir

WHY DELTAUP

Most AI projects start with a tool. We start with work that is stuck.

TOOL - FIRST

Starts with a technology and looks for a use

“It feels faster”

The vendor reports the result

Promises “10×” before looking

Sells licences and hours

BOTTLENECK - FIRST

Starts with a queue of work that waits

Minutes per unit, before and after

The process owner signs the baseline and the result

Sets the target after the baseline is measured

Is paid only for a measured difference

HOW THE Δ IS BUILT

A tool is one layer. Moving a number takes nine.

- 9 **Prove & Sustain** Measure after with the same ruler. Keep it live. Next bottleneck. ✓
- 8 **Adoption** Train the team, change the routine, make it the default. ✓
- 7 **Implementation** Build, connect to your systems, run in shadow mode. ✓
- 6 **Solution Finding** Test the ideas and pick the cheapest one that moves the number: a process change, a form, then AI. ✓
- 5 **Ideation** Generate many options fast, with AI in the room: dozens of ideas in an hour, not a month. ✓
- 4 **Baseline** Measure before. The process owner signs the number. ✓
- 3 **Prioritization** Rank by volume × time × cost. Pick the one that pays. ✓
- 2 **Research** Check the market: who solved it, what it cost, what the benchmarks say. ✓
- 1 **Problem Discovery** Walk the process, read the logs, find where work waits. ✓

Our team runs **all nine layers**, end to end. That is our advantage: the more of the process is done, the higher the Δ rises. Tap a layer to try it.

THE DELTA METHOD

Five stages. Each one ends at a gate.

01

Find

FIND THE PROBLEM

Gate: an owner who
wants it fixed

02

Baseline

MEASURE BEFORE

Gate: the owner signs
the baseline

03

Build

TOOL AND SOLUTION

Gate: works on real
cases in shadow mode

04

Prove

MEASURE AFTER

Gate: target met, no
guardrail worse

05

Scale

EFFICIENCY, THEN REPEAT

Gate: monitoring live,
next bottleneck chosen

🔄 Fixing one constraint moves the constraint. Stage 05 hands the next bottleneck back to Stage 01.

WHAT WE MEASURE

Efficiency is four numbers, not one.

Time

How fast does one unit of work get through?

min / unit

lead time

wait

Quality

How often is it right the first time?

error rate

rework

hit rate

Cost

What does one unit cost, all-in?

cost / unit

staff-hours

Capacity

How much more can the same team handle?

units / day

backlog

Guardrails: every project improves one primary number and protects the rest, such as fairness, customer experience and compliance.

EVIDENCE

Every number we report carries its evidence level.

- L1** **Estimate** Interviews. Used to prioritize, never reported as a result.

- L2** **Observed** A timed sample by us, 30 or more units.

- L3** **Logged** System timestamps for the full population.

- L4** **Controlled** Parallel run or control group in the same period.

Only L3 and L4 results count toward our fee.

CASES

Six places where the difference is easy to see.

HUMAN RESOURCES

Resume review

Δ 20× faster

PRODUCTION & PLANNING

Machine downtime

Δ 43% less downtime

SALES & MARKETING

Lead response

Δ 380× faster

FINANCE & ACCOUNTING

Month-end close

Δ 5 days sooner

SUPPLY CHAIN

Demand forecast

Δ stockouts halved

PROCUREMENT

Purchase approvals

Δ 4× faster

HUMAN RESOURCES

Finding star candidates in hours, not days

Fictional example · Group recruiting team. 1,200 resumes a month arrive by email and job boards.

Why it is real: The HR problem atlas lists 31 startups built on resume screening and matching alone.

OPERATOR MINUTES PER RESUME

Before		6:00
After		0:18

Δ 20× faster

Time to first review	3.5 days → 4 hours
----------------------	--------------------

Staff-hours per month	120 h → 6 h
-----------------------	-------------

PRODUCTION & PLANNING

Predicting machine failures before they stop the line

Fictional example · Beverage bottling plant. Two filling lines, 12,000 bottles an hour each, two shifts.

Why it is real: Augury, valued above \$1B, monitors machines for PepsiCo, Colgate-Palmolive and Hershey's. Siemens estimates unplanned downtime costs the world's 500 largest companies \$1.4 trillion a year, 11% of their revenue.

UNPLANNED DOWNTIME PER MONTH, BOTH LINES

Before		42 h
After		24 h

Δ 43% less downtime

Warning before a failure	none → 9 days on average
--------------------------	--------------------------

Lost output	504,000 bottles → 288,000 bottles
-------------	-----------------------------------

SALES & MARKETING

Answering every inbound lead in minutes, before it goes cold

Fictional example · Industrial equipment distributor. 900 inbound leads a month from the website, phone and messaging apps.

Why it is real: Salesforce paid about \$1.2B for Qualified, whose AI SDR answers inbound leads instantly. A Harvard Business Review study of 2,241 companies found that firms replying within an hour were about 7× more likely to qualify a lead. The average reply took 42 hours.

MEDIAN TIME TO FIRST REPLY

Before		19 h
After		3 min

Δ 380× faster

Leads never contacted	21% → 0%
-----------------------	----------

Leads that become a meeting	12% → 19%
-----------------------------	-----------

FINANCE & ACCOUNTING

Closing the month in 4 days instead of 9

Fictional example · Holding company with six subsidiaries and one consolidated monthly close.

Why it is real: FloQast, valued at \$1.6B, serves more than 2,600 accounting teams. APQC's benchmark of 2,300 organizations puts the median close at 6.4 days, and a 2025 survey found 94% of finance teams still reconcile in Excel.

BUSINESS DAYS TO CLOSE THE MONTH

Before		9 days
After		4 days

Δ 5 days sooner

Hours on reconciliations per month	160 h → 55 h
------------------------------------	--------------

Reconciliations done by hand in Excel	140 → 30
---------------------------------------	----------

SUPPLY CHAIN

Fewer empty shelves with less stock

Fictional example · Food distributor. 1,800 products delivered to 40 stores and customers.

Why it is real: RELEX Solutions, valued at \$5.8B, runs forecasting and replenishment for 350+ retailers and suppliers. IHL Group puts the global cost of out-of-stocks and overstocks at \$1.77 trillion a year, 6.5% of retail sales.

ORDER LINES OUT OF STOCK

Before		7.5%
After		3.8%

Δ stockouts halved

Forecast error (weighted)	38% → 24%
---------------------------	-----------

Days of inventory on hand	46 → 37
---------------------------	---------

PROCUREMENT

From request to purchase order in 4 days, not 16

Fictional example · Shared procurement desk for the whole group. 650 purchase requests a month.

Why it is real: Zip, valued at \$2.2B, runs purchasing for large enterprises and reports more than \$6B in customer savings. Dollar Tree cut its procurement cycle time by 70%.

MEDIAN DAYS FROM REQUEST TO PURCHASE ORDER

Before

16 days

After

4 days

Δ 4× faster

Requests sent back for missing information

34% → 8%

Manual approval steps per request

5 → 2

Ready-made agents, each with a measured Δ.

PRODUCT	WHAT IT DOES	PRIMARY METRIC · BEFORE → AFTER	OUR Δ
 TickUp	OKRs with an AI Check-in Coach. Reviews every Key Result weekly and flags drift early.	Key Results updated on time each week 35% → 90%	 Δ +55 pts
 NIVO	CEO Assistant. A daily voice and one-page sales brief; the CEO asks questions by voice.	Days a week the CEO starts with today's numbers 1 → 5	 Δ 5×
 Lead Finder	Finds and qualifies new leads from public sources, ready for outreach.	Qualified leads per rep-day 6 → 30	 Δ 5×
 Star Resume Detection	Ranks incoming resumes so recruiters open likely stars first. People make every decision.	Star candidates found in the first 20% reviewed 20% → 78%	 Δ +58 pts
 Skill Gap Analysis	Maps each person's skills against the role and shows the gaps to close.	Employees with a mapped skill profile 15% → 95%	 Δ +80 pts
 Next Product: Customize Your Organization	We find your bottleneck and build the agent for it.	Your metric, set after a signed baseline	 Δ you define it

Example targets. Each product's real Δ is set after a signed baseline in your organization.

PRICING

Pay only for the difference.

STANDARD PLAN

Measured difference below the agreed target: **you pay nothing.**

Target met: **one standard fee**, fixed in the contract before we measure.

AMBITIOUS PLAN

The fee rises in fixed, pre-agreed steps as the measured improvement grows.

Below the target		0
Target reached		1.0×
1.5× the target		1.4×
2× the target		1.8×
3× or more		2.5× cap

A difference counts only when measured at L3 or L4, with the same method as the signed baseline, and no guardrail got worse.

HOW WE START

Three steps, each one small enough to say no to.

STEP 1 · 2 WEEKS

Bottleneck Audit

We walk your processes, pull the logs and rank where time and money leak.

Free

STEP 2 · 4-6 WEEKS

Proof Sprint

One bottleneck, from signed baseline to measured result.

Paid only if the target is met

STEP 3 · ONGOING

Scale & Ledger

Rollout, monitoring, a monthly Value Ledger and the next bottleneck.

Standard or Ambitious plan

MINI-GAME • 30 SECONDS

Guess the Δ

3 real projects. Drag the blue bar to where you think DeltaUp takes them.

Play

Example figures from the DeltaUp cases.

Start with a free Bottleneck Audit.

Tell us which process feels slow. We measure it, and you decide with the numbers in front of you.
